

It is approved
on meeting of department of
medical informatics, medical and biological physics
27 August 2020
Minutes №1 of 27 August 2020

Head of department  O.V.Silkova

Methodical instructions

for students' self-preparation work at preparation for a practical lesson
at home and at the classroom

Subject matter **Medical and biological physics**
The unit 1. Fundamentals of higher mathematics and
biological physics
Theme of lecture: **The total module control work #1.**
Year 1
Faculty Stomatological
Speciality Stomatology

Poltava - 2020

1. The topic significance.

A number of biophysical processes and phenomena in a human organism have the mechanical nature. They are described by mathematical method, the same as any other process in biological systems. Integration of knowledge received in previous topic at preparation to final control promotes better comprehension of processes proceeding in human organism.

2. Specific targets.

To have general and specific knowledge on the studied topics;
To understand, to remember and to use the received knowledge;
To form the professional experience by reviewing, training and authorizing biophysical information.

3.A base level of preparation

The previous (providing) disciplines	Received skills
Mathematics, physics, biology	To provide calculation of received data. To speak about studied physical concepts. To speak about studied biological concepts.

4. The organization of the content of a teaching material

The list of theoretical problems to a total modular control №1.

1. Deformations, their types. Elasticity and plasticity. A Hooke's law. Modulus of elasticity.
2. Determination of resilient (elastic) properties of biological tissues. Determination of a the bone Young's modulus.
3. Deformation properties of biological tissues. Elasticity. Plasticity. Visco-elastic properties. Durability. Bones deformations. Bone's structure and shape features

- supplying high durability of bones.
4. Deformation properties of biological tissues: bones, muscles, ligaments, blood vessels and others. Roles of inorganic and organic substances in mechanical properties of different tissues.
 5. Muscle contraction mechanism. Calculation of muscle work. Dynamometry and ergometry.
 6. Biomechanics of human locomotor apparatus. Joints, types of joints and corresponding levers. Bones. Elastic properties of bones and muscles.
 7. Biomechanics of human musculoskeletal apparatus. Joint types. Degrees of freedom of different joints. Levers.
 8. Biomechanics of human locomotor apparatus. Muscles. Types of muscles. Structure of muscular cell. Mechanism of muscle contraction.
 9. Acoustics. Sound nature. Physical characteristics of a sound. Sound rate. Resonance.
 10. Ultrasound, physical characteristics of ultrasound. Key properties and features of ultrasonic sound propagation in mediums. Influence of ultrasound on biological tissues and human organs.
 11. Infrasound, physical characteristics of infrasound. Action of ultrasound and infrasound on biological tissues and human organs.
 12. Human ear: main parts and structure. Characteristics of hearing. Principle of hearing. A scale of intensity and a scale of volume of sound, units.
 13. Physics of hearing, the characteristics of acoustical sensation. The Weber-Fechner law. Physiological characteristics of a sound.
 14. An audiogram registration. Audiometry. Hearing threshold and pain sensation threshold.
 15. Surface tension. Coefficient of a surface tension and methods of its determination. Mechanism of appearance of embolism.
 16. Methods of definition of a surface tension coefficient of fluids.
 17. Internal friction. Viscosity. The formula of Newton for an internal friction. The Newtonian and non-Newtonian fluids. Viscosity of blood.
 18. Method of blood viscosity determination by viscometer BK-4. Describe Hess method.
 19. Laminar and turbulent flows. Reynolds number. Bernoulli equation. Flow of viscous liquids. Poiseuille formula. Hydraulic resistance.
 20. Biophysics of blood circulation. The analysis of heart work. Changing of speed and pressure in blood vessels. Types of blood vessels.
 21. Analysis of a cardiac work. Measurement of a blood pressure by Korotkov method.
 22. Structure of biological membranes. Physical properties of biomembranes. Liquid-crystal state of biomembranes. Dynamic properties of biomembranes.
 23. List and describe functions of biomembranes. Membrane permeability.
 24. Methods of studying of a biological membranes permeability.
 25. Passive transport of substances through biomembranes. Fick equation. Velocity of a diffusion. The Nernst-Planck equation. An electrochemical potential.
 26. Biomembranes: the active transport. List its main types. Molecule basis of active transport on example of K^+ - Na^+ -pump work. Conjugation of ionic currents.
 27. The nature of membrane rest potential. Active and passive ionic transport. Membrane permeability changes. Equilibrium Nernst potentials for different ions. Diffusion potential. Donnan potential.
 28. Stationary fluxion of fluids. A continuity equation. The linear and volumetric velocities. The basic dynamical equation of fluids.
 29. A scale of intensity and a scale of sound loudness, measurement units. Hearing threshold and pain sensation threshold. Their values and dependences on frequency.

30. Action potential (AP). A hypothesis of AP originating. The equivalent circuitry of a membrane. Phenomenological Hodgkin-Huxley equations. Concept about the gate ionic currents.
